

Deleting Coverage Logging

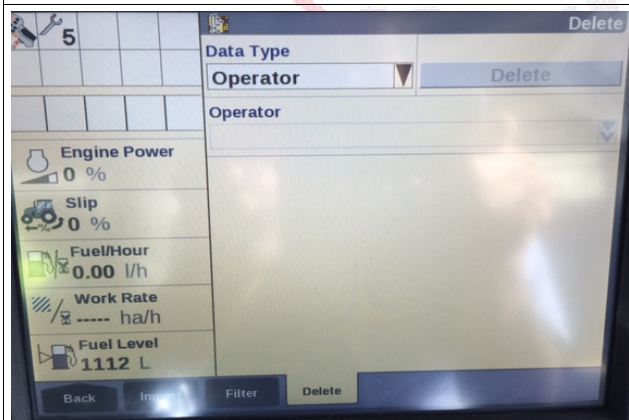

You may want to Delete the Coverage Logging on your PRO 700 to free up space which will help ensure the ongoing reliability of the PRO 700 as well as reduce the time required for Downloading Paddock Information.

If you are using the recorded information for mapping (variable rate), etc make sure that you have **downloaded and backed up this data** and **saved on a computer** or another USB before deleting the coverage.

Please note that in this case, using AFS Software will assist in sorting through the data to sort through what is required and what is not required.

Press on the **Data Management** Icon

On the bottom of the screen, Press the **Delete** button

Select the Data you would like to Delete

TO DELETE COVERAGE LOGGING (GREEN LOGGING)

Under 'Data Type' Press the White Icon and select 'GPS DATA'

Then select the Grower, Farm and Field of which you would like to delete the Data from.

Once deleted, return to your Run Screen and Click out of the Field and back into it to Refresh. The Coverage Logging should have disappeared now.
